Title	Using the International Classification of Functioning, Disability and Health (ICF) as a tool to promote transdisciplinary intervention on Primary Health Care
Type	Oral Presentation <i>Building the Capacity of Future Leaders in a Socially Accountable World</i>
Presenting Author	XIMENA SUAREZ
Co-Authors	Mariola Ruiz
Country	Mexico
Abstract N°	TUFH483
Content	<p>Using the International Classification of Functioning, Disability and Health (ICF) as a tool to promote transdisciplinary intervention on Primary Health Care One of the biggest challenges that Medicine faces in the XXI century is it to put people at the center of health care, instead of the old model that was focus only on the diseases. The most important contribution to the PHC is that it eradicates the fragmented visión and communication towards the complex interdependent health world. Putting people at the center of health care means that we have to focus on the participation and functioning of the people instead of focusing on the deficits. This represents a complete change on the health paradigm over the past decades, in which excessive specialization of health care providers have lead to a desintegration of each participant of the health team with out taking into account the context of the individual and their enviromental factors. The complexity and interrelationship of contemporary health systems compromises the health system to work on a multidisciplinary and transdisciplinary team in order to respond to the challenges to a changing world that more than ever needs to be correlated. The International Classification of Functioning, Disability and Health is the international standard for framing, describing, recording and measuring functioning and disability (WHO 2019). The importance of a model like this in the PHC because it encorages leaderahips reforms that make health authorities more realible and also the capacity to form leaders in a socially accountable world.</p>
